

pjs.fields()

The value returned by this method can be passed to [file.update\(\)](#) to control which fields are updated in the record.

Parameters

Field name - this parameter can be repeated as many times as needed.

Return Value

A list of field names that can be passed as the last argument to [file.update\(\)](#). If the field list is not specified, all fields in the record are updated.

Example

Update selected fields only

```
var updateFile = pjs.defineTable("updateFile", { read: true, update: true });
updateFile.fetchNext();
field1 = 100;
field2 = 200;
updateFile.update("recName", pjs.fields(field1, field2));
```

RPG Equivalent

%FIELDS()

Requirements

This API requires the [Profound.js Connector](#) module.
