

display.grid.applyFilter()

The applyFilter() method replace grid records with the records that satisfy the provided testing function.

Parameter

1. Callback function that receives the following arguments:
 - a. Record object with properties for each field in the grid
 - b. Index - the zero-based index of the current grid record being processed
 - c. Records array - array representing all of the grid records

The function must return true when the test condition is met.

Example

```
// Remove records where the "remove" Boolean Indicator was set to true
// In a Rich Display application, this could be triggered by the user clicking a Remove button with a bound response
property
display.grid.applyFilter(entry => !entry.remove);
```
