

pjs.setFields()

This API sets field values using the properties of a JavaScript object.

Each object property that has a matching declared field is used to set the field value.

Parameters

- primitive JavaScript object

Example

```
// Retrieve data into a record object by querying a table using product id
var record = pjs.query("SELECT * FROM productsp WHERE prid = ?", prid, 1);

// Set matching global declared fields, including any screen fields
pjs.setFields(record);

// Display the screen
display.myform.execute();

// Retrieve user input back into the record object
record = pjs.getFields(record);
```
