

# On - Off Switch

## Overview

The On/Off switch is similar to the [Checkbox](#) and is commonly used for setting a flag type field. This could represent a yes/no, on/off type of choice. Typically the On/Off switch widget is used in mobile applications. Its value property is most often bound to a 1-character field, such as 'Y' / 'N', '0' / '1'. **(Rich UI Only)**

## On/Off Switch Properties

**on value** - This property specifies the value to return when the widget is in the 'on' state.

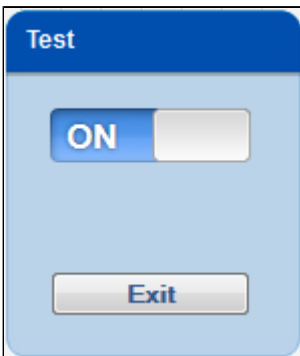

**off value** - This property specifies the value to return when the widget is in the 'off' state.

**on text** - Sets the text displayed when the switch is in the 'on' state. The default value of the property is 'On'. This property may be bound. **(Rich UI Only)**

**off text** - Sets the text displayed when the switch is in the 'off' state. The default value of the property is 'Off'. This property may be bound. **(Rich UI Only)**

**wide handle** - Sets the size of the handle displayed on the on/off switch for switching. The default value of the property is 'true'. This property may be bound to an indicator. **(Rich UI Only)**

Example of the wide handle property set to 'true' (default setting):

Example of the wide handle property set to 'false':
