

# PowerCharts

## Overview

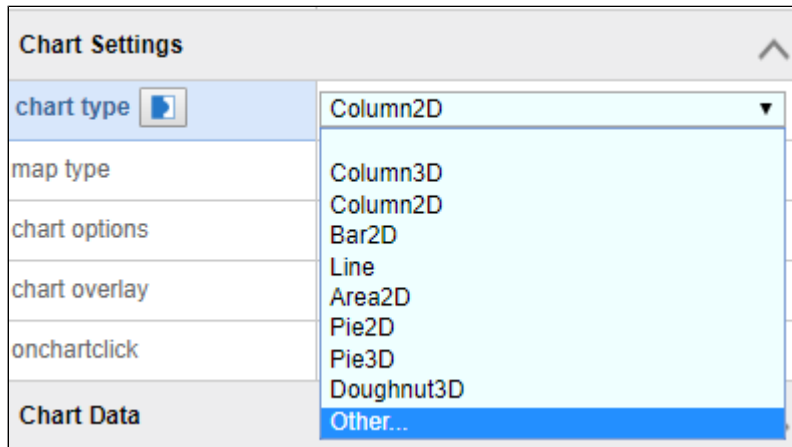

PowerCharts are more advanced and specific chart types than column, line, pie or area charts. Some are interactive and allow the user to adjust nodes, columns, or lines.

All PowerCharts are [Fusion Charts](#) and have the same properties as regular charts.

## Using a PowerChart

There is no separate icon in Visual Designer or Genie for FusionCharts. To use a PowerChart in Visual Designer or Genie, drag any of the chart widgets (column, line, bar, etc.) onto the canvas/page.

Then change the chart type property to "Other...", and you'll be able to type the name of the chart.

Enter the FusionCharts name of the chart. See the section below, "List of Common PowerCharts", for the names.

You'll notice the icon of the widget change to a default, generic chart image.

To supply data to the chart you have several options. Please consult the [FusionCharts](#) page to learn how to supply data to the chart.

## List of Common PowerCharts

The table below lists some PowerCharts along with the **chart type** value needed to use it. The value for **chart type** is case-insensitive.

PowerChart	value for "chart type"	Preview
Spline	spline	
Error Line Chart	errorline	
Radar	radar	

Heat Map	heatmap	
Multi-level Pie Chart	multilevelpie	
Drag Node	dragnode	

All chart/widget names are listed in <http://www.fusioncharts.com/dev/getting-started/list-of-charts.html#powercharts-xt>. Follow the links on that page for a complete list of attributes.
