

CRUD Generator

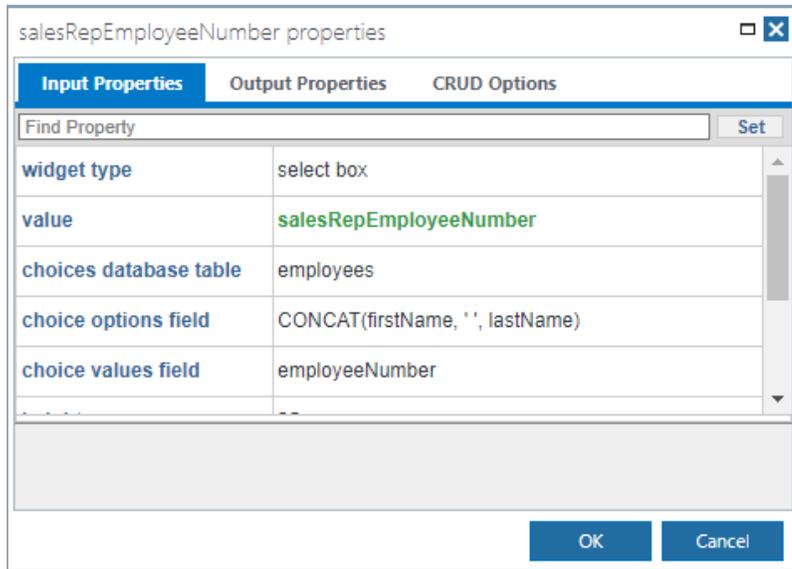

Profound.js provides a CRUD Generator for low-code applications. Given a database table, it can generate an application for searching, adding, editing, and removing database records for that table.

The generator creates both the screen design and the application logic. Since the logic is built using low-code routines, there is no code to maintain going forward.

Before You Start

Before using the generator tool, you can configure database table columns for CRUD generation. While this configuration step is not required, it gives you an additional level of control over how the application is created. Use this step to specify which columns to use and how column-related widgets will appear. Under the Database tab, double-click each column to set its properties.

Input and Output properties control how the widgets appear. For example, you can configure the salesRepEmployeeNumber field to appear as a dropdown that retrieves its choices from the employees table.

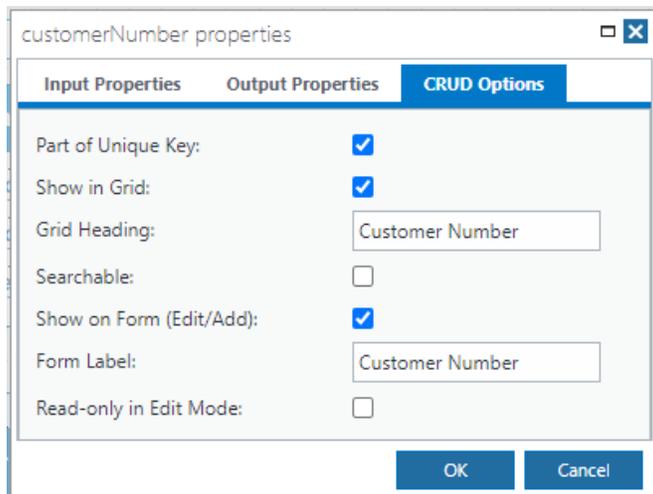

The screenshot shows a dialog box titled "salesRepEmployeeNumber properties" with three tabs: "Input Properties", "Output Properties", and "CRUD Options". The "Input Properties" tab is selected. It contains a "Find Property" search box with a "Set" button. Below is a table of properties:

Property	Value
widget type	select box
value	salesRepEmployeeNumber
choices database table	employees
choice options field	CONCAT(firstName, ' ', lastName)
choice values field	employeeNumber

At the bottom of the dialog are "OK" and "Cancel" buttons.

The CRUD Options tab lets you specify how database columns are used.

The screenshot shows a dialog box titled "customerNumber properties" with three tabs: "Input Properties", "Output Properties", and "CRUD Options". The "CRUD Options" tab is selected. It contains several options with checkboxes and text input fields:

- Part of Unique Key:
- Show in Grid:
- Grid Heading:
- Searchable:
- Show on Form (Edit/Add):
- Form Label:
- Read-only in Edit Mode:

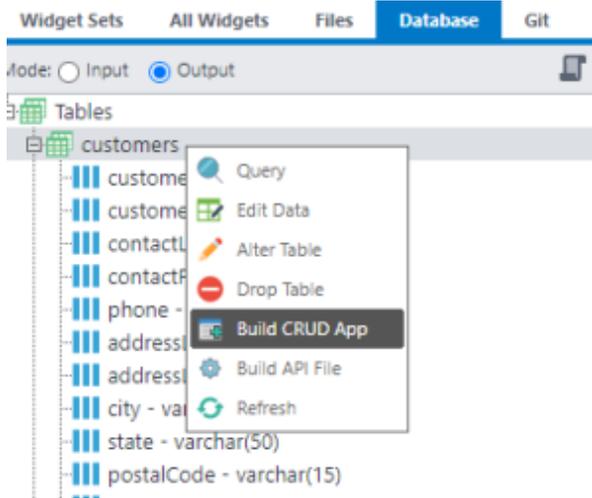

At the bottom of the dialog are "OK" and "Cancel" buttons.

You must specify which columns make a unique record within the database table. The CRUD Generator will use this information to retrieve records for editing. If the table has a unique primary key defined at the database level, this information will be used by default.

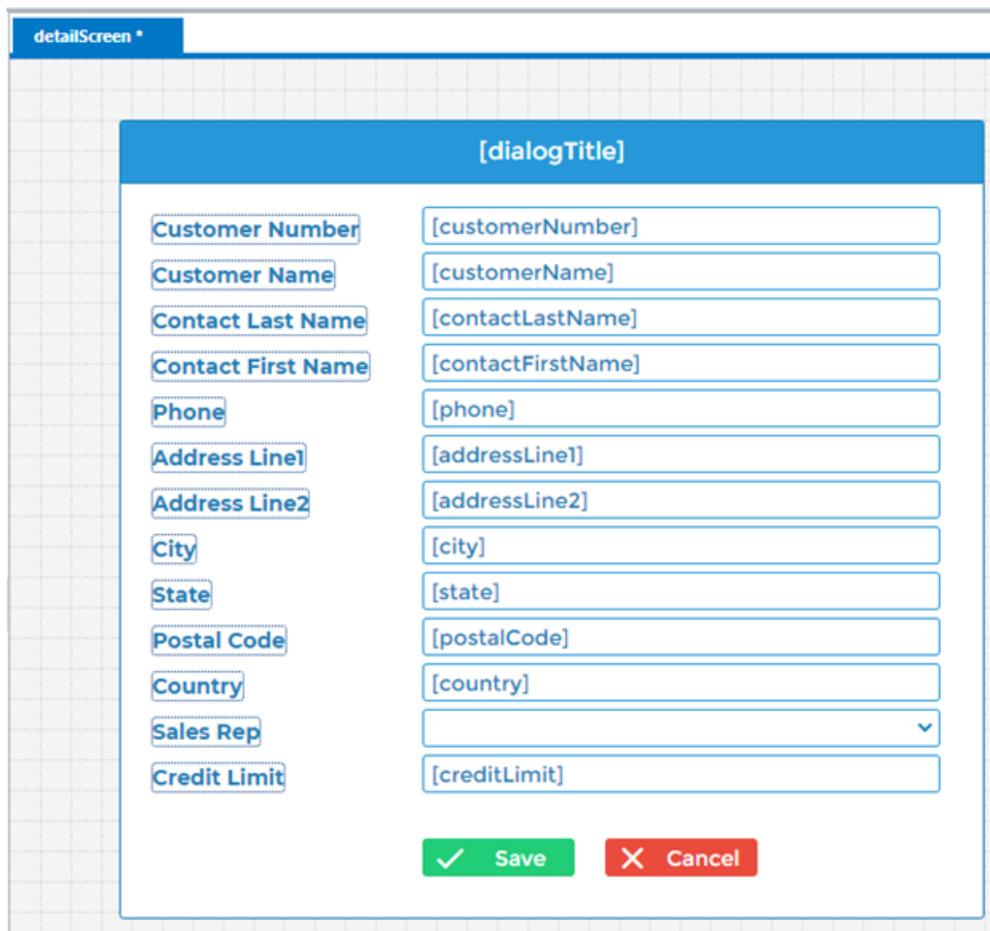

You can then specify which columns should appear in the grid and whether they should be searchable and/or editable.

Generating an Application

To generate an application, right-click the desired database table under the Database tab and select "Build CRUD App".

A Rich Display File application for this table will be created immediately with all of the necessary screens.

The logic will be attached to the screens as low-code routines.

Screens		Fields		Elements		Logic	
Routine ▲				Where Used			
load records				mainScreen (initial routine)			
add button click				mainScreen/AddButton (onclick)			
clear search				mainScreen/ClearIcon (onclick)			
edit icon click				mainScreen/EditIcon (onclick)			
delete icon click				mainScreen/DeleteIcon (onclick)			
save button click				detailScreen/SaveButton (onclick)			
cancel button click				detailScreen/CancelButton (onclick)			

Saving and Trying the Generated Application

To try the application, you must save the Rich Display and call it, either from another program or directly. To be able to call the Rich Display file directly, first configure it as an **App Start File** or an **Express Route (Rich Display File App)** within your **workspace**.
