

IASP Support

Profound.js can be installed onto an IASP, and also supports working with user data and objects that are stored on an IASP.

- To install Profound.js onto an IASP, see the standard [installation instructions](#).
- To enable working with user data and objects that are stored on an IASP, set the **Initial ASP Group** setting on the user's job description to the ASP group containing the necessary libraries. For performance reasons, this setting is retrieved from the user's job description the first time that the user signs on and is then cached in the server's memory. So, changes to the user's job description will not be reflected until the server is restarted.
