

Allow Any Select Statement

Allows any valid SELECT SQL statement. If this is **false** (default), a row count is retrieved by running `SELECT COUNT(*) FROM (your-custom-sql-property)`, so your "custom sql" property must work with that syntax. This prevents the use of common table expressions, the optimize clause, and a few other things. If set to **true**, the row count will be determined by running your statement as-is and looping through all rows to count them.

Note: False performs better, but true allows a wider variety of SQL statements.

Promptable? DROPDOWN

Possible Values: true, false

Bindable? YES

Products: ProfoundUI, Genie
