

# MIMIX and Replication Software

Running mirroring/replication software while trying to install Profound UI has also been known to cause issues with the installation process. The problem with replication software (such as MIMIX) is sometimes the software locks the QGPL save files while our installer is attempting to restore them, resulting in a failed installation and an error message from the installer. After the QGPL save files are uploaded and restored, the installer immediately deletes them. So, these files are temporary and there is no reason to replicate them.

To correct this issue, the following files can be configured to be omitted from the replication software:

**QGPL/PUI**  
**QGPL/PUI2**  
**QGPL/PUI3**  
**QGPL/PUI4**  
**QGPL/PUI5**  
**QGPL/PUISAMPLES**
