

# Scrollbar

**Genie:** Determines whether a vertical scrollbar for paging through data records will appear within the grid. If the grid is not a database-driven grid, the scrollbar will automatically send the PageUp/PageDown keys to the underlying application.

**ProfoundUI:** Determines the type of vertical scrollbar used to scroll through records within the grid. A sliding scrollbar scrolls freely, while a paging scrollbar scrolls one page of records at a time only.

**Promptable?** DROPDOWN

**Possible Values:** none, sliding, paging

**Bindable?** YES

**Products:** ProfoundUI, Genie

Clicking up or down on the scrollbar has the same effect as typing the PageUp or PageDown keys respectively.

Limitation: If a Rich Display file has more than one subfile grid, then the PageUp and PageDown keys are ignored; then scrolling can only happen using the scrollbars or paging controls.
