

Profound.js Overview

Profound.js is a business application development platform for Web and Mobile applications. It helps in both creating new applications and modernizing legacy code.

For new development, Profound.js provides an intuitive low-code approach to building applications quickly and easily on any computing platform. It can run on your inhouse servers or in the cloud, and provides seamless integration for various types of databases. Profound.js also makes it easy to interface with your traditional systems of record by directly calling your existing Programs and Service Programs.

For modernization, Profound.js modernizes legacy IBM i (AS/400) code with an agile, iterative, and low risk approach that taps into the capabilities of open source and Node.js. It works together with [Profound UI](#), the user interface modernization platform. It also helps to modularize your legacy application components and allows you to expose legacy logic as reusable API.
