

Selection Field

This property must be bound to an indicator or character field, which will be used to both set and return the selected state on each record. If a character field is specified, the "selection value" property will be used to populate the field when a row is selected.

Promptable? NO

Possible Values: Must be bound

Bindable? YES

Products: ProfoundUI

The "row selection" property enables a user to select one or more rows. This property preserves those selections after a screen is submitted.

For example, the two properties can be set on a Load-All grid:

row selection	multiple (simple)
selection field	selectnflid

Then rows on the grid may be selected:

PRID ▲	PNAME
 5 GRAI1018	5 GRAIN FRUIT AND NUT CEREAL B
 ABC 4715	ABC 4 STEP POCKET AIDER
 ABC AC904	ABC ACCESSORY BELTS
 ABC AV889	ABC AVALANCHE PROBE
 ABC BE839	ABC BELAY SEAT
 ABC BI961	ABC BIG WALL GEAR SLING
 ABC BL717	ABC BLENDS

And when the screen is submitted, the selections are transmitted to the ProfoundUI handler:

```
▼ Form data
GRIDAPILA.BTNEXIT: "0"
GRIDAPIA.BTNSUBMIT: "1"
SFLAPILA.SELECTNFLD.19: "1"
SFLAPILA.rm: "19"
SFLAPIA.rm: "2"
SFLAPILA.SELECTNFLD.2: "1"
toprm.i: 742
```

Then the handler responds, and the page loads with the grid selections as indicated by the selection field.
